

# Box-type transformer connection distribution box

## Overview

A box type transformer is a compact outdoor power distribution unit that combines transformer, HV/LV switchgear, and protection systems in one enclosure. It's widely used in residential, commercial, and temporary grid installations for easy deployment and safe, efficient power. However, box transformers (also known as prefabricated substations, outdoor power distribution units) have occupied more than 60% of the global distributed power distribution equipment market (source: Global Market Insights 2024) with their core characteristics of "factory prefabrication. A box type transformer solves these issues by combining transformer, HV/LV switchgear, and protection in one compact unit—cutting footprint, simplifying installation, and ensuring reliable power for residential, commercial, and temporary grids. These compact and self-contained units have revolutionized the way power is distributed, offering significant advantages in. An electrical transformer box is a protective, enclosed unit containing a distribution transformer, which steps down high-voltage electricity to lower, usable voltages for homes and businesses.
