

Can an optical power meter measure the sun

Overview

Although most people want to make measurement in units of dBm or Watts, an optical power meter is only capable of measuring either the current or the voltage generated by a photodetector. When interfacing with a photodiode, the quantity that must be measured is current. The term usually refers to a device used for measuring the average power in fiber optic systems. Other general purpose light power measuring devices are usually called radiometers, photometers, laser power. This refers to the amount of solar radiation falling on a given surface area, often expressed in watts per square meter (W/m^2) or lux (lumens per square meter). Newport's 1936/2936-R Series Optical Power Meters are among the most versatile power meters in the market, and the NIST researchers have pioneered a revolutionary technology for measuring large and small quantities of optical power by detecting radiation pressure that light exerts on a mirror.
