

How long should the optical cable be before fiber optic splicing

Overview

According to experience, it is appropriate to peel the length of the optical cable in the range of 50~100CM and pay attention to the strength of the stripping. ② Insert a fiber protection sleeve into the fiber that needs to be fused. Splicing fiber optic cable is an extremely important phase for making dependable, high-speed communication infrastructures. As fiber optic cables are generally only produced in lengths up to around 5 km, so when lengthier connections are needed, splicing two cables together becomes. Before any splicing can occur, whether it's mechanical or fusion splicing, the fiber optic cable must be meticulously prepared. The preparation process is far more than just stripping away layers of protective coating. It involves a series of carefully executed steps, each critical to ensuring a. Insert the spliced fiber optic cable, keep it straight and tensioned and apply the press. Use a splice cassette to accommodate the excess fiber length.
