

# How many meters of switch are needed for a 100m fiber optic connection

## Overview

Place a switch every 100 meters to extend the network (e., security cameras, Wi-Fi access points), PoE extenders boost both data and power . If you need to cover more than 100 meters (e., connecting two buildings 200 meters apart), use these solutions: Ethernet Switches: A switch acts as a “signal booster”—it receives the weak signal, cleans it up, and retransmits it., 200. If you have multiple Ethernet switches that need to be connected over long distances, fiber is obviously a preferred choice. It can provide significantly higher bandwidth and carry more data. How many switches in IDF will connect to core?

How many connections per switch (it is not uncommon to have redundant/bonded connections)?

How much allowance for future connections or bad/broken strands do you want?

Note that bad and broken strands are rare, but I have now known anyone who starts. The usual solution involves using a PoE switch with at least 30W power output, and a PoE Extender every 100m to re-energize the data signal. If you have several cameras, the cost of long range PoE setups can be costly when you account for the cost of the extenders, and difficult to accomplish for. The maximum distance for Power over Ethernet (or any network data transmission) is 100 meters or 328 feet. If you are familiar with FOA's other design materials, you know we don't give you formulas or outlines to follow.
