

In which cabinet is the relay protection device used

Overview

Interposing Relay (IPR) cabinet is used in industrial automation systems along with automation devices for proper controlling of load circuits such as Electrical feeder contactors for motors & compressors, Air Conditioning systems, Lamps, Fans, etc. They are used effectively in the following applications: This equipment is ideal for both newly constructed. The group of relay protection includes RPA cabinets, operational current cabinets, own-use cabinets, signaling and telemechanics cabinets. Reliable components ensure system faultlessness and durability. In operating environments. An Interposing Relay (IPR) is an auxiliary relay used to electrically isolate and interface two dissimilar systems, such as a 24 V DC PLC output and a 230 V AC contactor or motor starter. It protects sensitive PLC and DCS outputs from high current, inductive loads, and voltage transients while. In many industries, where precision, control and reliability are key elements, control cabinets are becoming an integral component of numerous electrical systems. Failures of various kinds in power distribution. Numerical relays are based on the use of microprocessors.
