

Industry Standards for Relay Protection Testing

Overview

IEC 60255-5 is the standard that defines insulation coordination for these devices — the test voltages, impulse withstand levels, and minimum insulation resistance values that every protection relay must meet. Protection relays are major players in electrical power networks, safeguarding systems from faults and ensuring seamless operations. Since the basic function of a protection relay is to correctly function under abnormal. The scope of TC 95 is the standardisation of measuring relays, protection equipment, and protection functions embedded in any equipment or systems used in various fields of electrical engineering covered by the IEC, including combinations of devices and functions that form schemes for power systems. Protective relays and devices have been developed over 100 years ago to provide “last line” of defense for the electrical systems. To maintain high standards, engineers worldwide refer to the IEC standard for relay testing.
