

Lifespan of outdoor overhead optical cables

Overview

Theoretical Lifespan: 30 to 50 Years. In a perfect vacuum, the silica glass (SiO_2) core does not degrade. Manufacturers like Wolontek design cables to remain within attenuation specs for this period. We often hear that fiber optic cable lasts "a lifetime." The reality is more nuanced: silica The optical core is virtually chemically indestructible, but the sheaths, coatings, and. Fiber optic cables for outdoor applications are engineered to withstand the more demanding conditions seen outside, from environmental extremes to mechanical forces. These are the outdoor fiber optic cables you see strung along telephone poles (aerial), installed inside an underground duct, or even. The scalability of today's optical fiber to support higher speeds is virtually unlimited, to speeds 60,000 times higher than today's 10 Gigabit per second (Gbps) systems to individual homes or businesses. Others, installed in the 1990s, are still running. The degradation of optical cables over time is influenced by various environmental and operational factors: Mechanical Stress: Excessive tensile strain during installation or operation can accelerate fiber breakage.
