

PoE switch length

Overview

The standard PoE switch distance limit is 100 meters, as defined by Ethernet transmission properties. A network connection outside the established 100-meter restriction will experience weakened signal strength. In PoE (Power over Ethernet) technology, the Ethernet link between the Power Sourcing Equipment (PSE) and the Powered Device (PD) has a clearly defined maximum distance limit—100 meters (328 feet). This allows a single cable to provide both a data connection and enough electricity to power networked devices such as wireless access points. The fundamental PoE max distance remains 100 meters (328 feet) for standard installations, dictated by Ethernet protocol limitations rather than power delivery constraints. However, modern extension technologies now enable reliable operation up to 800 meters and beyond, while emerging IEEE 802.3af/at/bt Ethernet standards that define PoE and applies equally across all generations of PoE and types of Ethernet. High end PoE switches (such as Tengda monitoring dedicated models) can extend the power supply distance to 200-250 meters through automatic speed reduction negotiation (10Mbps).

Standards-based Power over Ethernet is implemented following the specifications in IEEE 802.3af-2003 (which was later incorporated as Clause 33 into IEEE 802.3-2005) or the 2009 update, IEEE 802.3at. The standards require Category 5 cable or better for high power levels but allow using Category 3 cable if less power is required. In multi-pair cases, PoE supplies power as a common-mode signal over two or more of the differential pairs
