

Protection distance of factory electrical distribution box

Overview

For indoor electrical installations, the dedicated space must be of equal depth and width to that of the equipment itself and extend from the floor to a height of 1.83 meters (6 feet) above the equipment or to the structural ceiling, whichever is lower. Is distance satisfactory to protect power distribution boxes (breaker boxes, disconnects ranging from anywhere from 50 volts to 440 volts) from damage in active warehouses with stacked material, fork truck traffic, and pedestrian traffic; or does there need to be a protective barrier?

If distance. Such protection relays are known as “distance protection relays” and only function in case of faults that occur between the location of the protection relay and the chosen reach point. Therefore, they provide discrimination for short circuits that may occur in different line portions. The. Determine the total electrical power usage of the warehouse and, calculate the electricity demand for each area, workshop, machinery, equipment, etc. Consider. Except as required or permitted elsewhere in this subpart, the dimension of the working space in the direction of access to live parts operating at 600 volts or less and likely to require examination, adjustment, servicing, or maintenance while alive shall not be less than indicated in Table K-1. The IEC (International Electrotechnical Commission) and BS 7671 (British Standard for Electrical Installations) both provide essential requirements for electrical installations, including those for fuse boards like garage unit, consumer unit and distribution board.
