This presentation reviews the established principles and the advanced aspects of the selection and application of protective relays in the overall protection system, multifunctional numerical devices application for power distribution and industrial systems, and addresses some. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. For example, unselective protection operation during a medium voltage network fault will cause an outage for an unnecessarily large number of consumers. Engineering use: Relays are used on feeders, transformers, buses, motors, generators, and transmission lines to protect equipment and improve system. A complete portfolio of protection, control, and automation IEDs that ensure reliability, availability, safety, and operational efficiency of power grid substations. A product portfolio designed under full compliance with international standards, equipped with the latest cybersecurity features, and. What are Protective Relays, or Protection Relays?

Protective relays are used in industrial power generation and supply systems to open and isolate branch circuits in the case of excessive current. The method of connecting protective devices into the power system are presented, and some of the problems of making accurate observations of system conditions will be explored.
