

Relay protection CT ratio

Overview

Selecting the appropriate CT ratio is a crucial step in CT design! It is influenced by two key factors: the maximum load current and the maximum short circuit current. For example, a 400:5 CT steps down 400 Amps to 5 Amps—an 80:1 reduction. This allows high currents to be safely measured with standard 5-Ampere meters. Primary Current = Secondary Current $\times$ Turns Ratio These CTs are commonly used for residential, light commercial, and branch circuit monitoring. 1 Parameters for CT Sizing The CT nameplate data. Plug setting multiplier of relay is referred as ratio of fault current in the relay to its pick up current. Suppose we have connected on protection CT of ratio 200/1 A and current setting is 150%. Hence, fault current in the CT secondary. Quick Definition: Current transformer sizing is the process of selecting a CT ratio, burden, and accuracy class that converts primary current to a manageable secondary value without exceeding saturation or thermal limits, following IEC 61869 and IEEE C57.
