

Relay protection is the number th line of defense

Overview

They act as the first line of defense by detecting and isolating faults or abnormal conditions on power lines to prevent damage to equipment and ensure the safe and reliable operation of the network. In electrical engineering, a protective relay is a relay device designed to trip a circuit breaker when a fault is detected. Static Relays: Use electronic components without moving parts. This prevents damage to equipment, reduces downtime, and safeguards. It is a first line of defense for our system, very sensitive, the fault clearing time and the current setting value is lesser as compared with back up protection. It is responsible for all system protection. Always the primary protection is having the relay co-ordination of tripping before the.
