

Ribbon pigtails and bundled pigtails

Overview

Aside from these standard types, there are also bundled and ribbon pigtails, both serving as branch able options. Bundled pigtails find utility in industrial projects, while ribbon pigtails are prevalent in extensive communication undertakings like telecommunications. A fiber optic pigtail is usually a fiber optic cable with pre-terminated connectors at one end and exposed fibers at the other. A fiber optic pigtail is very practical for on-site terminations where fusion or mechanical splicers are used. Mass fusion splicing can fuse up to all 12 fibers in one ribbon at once. Pigtails connect optical fibers to network components, while ribbon fiber cable organizes multiple fibers within a single structure, enhancing space efficiency and connectivity. Supported fiber types are singlemode G657A1 and G657A2. Bunch pigtails consist of multiple individual fibers bundled together in a single jacket. These fibers are typically color-coded for easy identification.
