

The Role of Fiber Optic Extension Line Routers

Overview

The ONT connects directly to the fiber-optic line from your internet service provider, converting light signals into a usable internet connection. Fiber is a much better medium for carrying data than older copper wires. From there, the router takes over, distributing that connection to create your local area network (LAN) and manage traffic between all your devices. Additionally, the architecture incorporates Fiber Distribution Terminals (FDT) and Fiber Access Terminals (FAT) for further network distribution, Fiber Terminal Boxes (FTB) for end-user connectivity, along with Optical Distribution Boxes (ODB), Optical Splitter Boxes (OSB), and the Optical Network. Longer Transmission Distance: Leveraging optical fiber transmission, the access layer can cover a radius of up to 20 km. Data travels as light pulses through thin glass or plastic fibers, allowing for high bandwidth capacity and minimal latency.
