

# The switch in the distribution box bounces when started

## Overview

The RC debounce circuit is the easiest solution to implement. The RC debounce circuit is simply a resistor-capacitor (RC) network with a Schmitt trigger to block fast voltage changes and provide stable and reliable switching of electronic circuits for us in digital circuits. In the case of a floor-mounted switch counting the number of people entering a room, for example, a single person might end up being counted as a multitude. From the manufacturers specifications the contact bounce at 15rpm is 5.0ms maximum, lets see what its like when connected. The purpose of this method is to highlight safe working practices for electrical isolation which is similar as lock out tag out. Operators must wear necessary PPE as required by local conditions and task specific risk assessment. Before start of the electrical isolation work: Ensure that you are. When you push a button, press a mico switch or flip a toggleswitch, two metal parts come together.
