

Transient Characteristic Analysis and Relay Protection

Overview

Transient-based protection responds to short-lived features in the relay input currents and voltages. Fault transients are not powered by the sources present in the system but by the energy stored in the system components prior to the fault: transmission lines, capacitor. Professor Xiangning Lin has been working in this area since 1996. Scott Meyer, is a royalty free software called Alternative Transients Program (ATP) that incorporates much of the capability of commercial electromagnetic transient analysis software but isn't as well known outside of academia. Protective relays and devices have been developed over 100 years ago to provide “lastline” of defense for the electrical systems. They are intended to quickly identify a fault and isolate it so the balance of the system continue to run under normal conditions. The selection and applications of.
