

Types of OTN Optical Amplifiers

Overview

Optical amplifier types include Raman and three main types of Erbium-doped fiber amplifier (EDFAs): booster, inline, and pre-amplifier. Optical amplifiers form an amplified optical transport network (OTN) link over long distances, without the need for regenerators or for building. An optical transport network (OTN) is a digital wrapper that encapsulates frames of data, to allow multiple data sources to be sent on the same channel. This creates an optical virtual private network for each client signal. ITU-T defines an optical transport network as a set of optical network. Optical amplifiers extend the optical link power budget for building long-distance dense wavelength division multiplexing (DWDM) networks by amplifying up to 96 wavelengths (the full C-band). Typical fiber cables experience a loss of about 0. OTN provides carrier-grade transport with efficient multiplexing, robust forward error.
