

# Visualized Network Security Device System

## Overview

Tools like Rapid7 InsightVM provide automated asset discovery, risk prioritization, and continuous monitoring. Real-time attack surface visualization involves mapping all potential entry points for cyber attackers. By visualizing these factors, we can quickly detect and respond to potential threats. Network security devices are specialized tools used to safeguard computer networks from unauthorized access, cyber threats, and potential attacks. This technique helps in understanding complex data, identifying patterns, and improving network management by providing a clear visual. Controlling the communication of devices within a network by compartmentalization or segmentation is one of many techniques to protect and improve the overall security of networked systems. Occasionally, businesses purchase commodity server hardware and install custom software to create their own network security device.
