

What's inside the electrical control box of an injection molding machine

Overview

The motherboard of a plastic injection molding machine is the core component of its electrical control system, responsible for coordinating operational parameters, signal processing, and synchronization between machine components. If you've ever wanted to understand the electrical side of injection moulding, this is your beginner-to-pro guide. 7,316,553discloses a drive assembly for rotating and translating a shaft comprising a hollow shaft motor and a fluid cylinder. It is most commonly used for producing plastic parts, though it can also be applied to metals and glass. It's a go-to solution for high-volume production because of its precision. Apart from the Micro Processor based control provided on the injection molding machine the Mold also needs limit switches/Sensors, thermocouples, Alignment scales, Pressure Gauges etc to Control the Mold operation at various stages thru the life of the mold to ensure better quality products from. The clamping unit is a core component of an injection molding machine.
