

Why isn't the optical power meter displaying a negative value

Overview

When there's loss in a fiber optic system, the measured power is less than the reference power, resulting in a negative logarithmic value and a negative dB reading on the meter. A quick checklist for troubleshooting negative sensor readings: let the sensor stabilize, avoid handling it by hand, keep the beam inside the. In this video, we explain how to repair an Optical Power Meter that powers ON but does NOT show any optical power reading. You will learn:

- How an Optical Power Meter. A fiber-optic power meter is a quantitative measurement instrument, not a diagnostic tool by itself. Its sole function is to measure the optical power level arriving at a specific point in a fiber link, expressed in dBm or mW.
- 2 Controlling the PM100D much greater than zero is displayed. It provides an expert-curated supplier directory, buyer-focused technical background information, and structured selection criteria to support professional procurement decisions.
